Pipeline 3: Main Submission Notebook

CS156 Machine Learning Pipeline — Temilola (he/him)

Date: April 23, 2026 | **Prof. Watson**

Executive Summary

This notebook serves as the **narrative curator** and **primary submission artifact** for CS156 Pipeline 3. It integrates Phase 1A (14 from-scratch ML methods applied to 324 real user ratings across 4 modalities) and documents the augmentation pipeline (58K pseudo-ratings from MovieLens, TVAE, GenMatch, CVAE).

Key Results:

- **324 real ratings** collected under Latin-square + Thompson-bandit experimental design
- **14 ML methods** trained: GP, Kalman Filter, UKF, Particle Filter, HMM, Conformal Prediction, GenMatch, TVAE, LightGCN, HAN, BNN, Hierarchical ANOVA, IPW/AIPW, Thompson Sampling, CVAE
- **Movie-level variance dominates**: σ_movie = 0.60, σ_modality = 0.056 (causal + Bayesian methods agree)
- **Thompson sampling** cuts regret 77% vs random baseline
- **Augmentation pipeline**: +58K synthetic/pseudo-ratings, 7.5K synthetic features

Phase Status:

- ✓ Phase 1A: All 15 tasks (Tasks 1.0–1.15) complete with artifacts verified
- ⏳ Phase 1B: GPU heavy training (SDXL, Llama QLoRA, Motion LoRA, MusicGen) — *pending*
- ⏳ Phase 2–3: Trailer corpus + ACT III assembly — *pending*

---

1. Data Provenance & Collection

1.1 Real Ratings (324 samples)

The core dataset comprises **324 real user ratings** collected from Temilola using a **Latin-square experimental design** combined with **Thompson-bandit modality sampling**:

Aspect	Value
Rater	Temilola
Modalities	4 (all, poster, synopsis, metadata)
Ratings per modality	81
Total ratings	324
Rating scale	0–10 (1 decimal place)
Confidence scale	1–5 (categorical)
Temporal span	Apr 17–23, 2026
Design	Latin-square (ensure balance) + Thompson bandit (modality selection)

1.2 Augmentation Pipeline (58K pseudo-ratings)

To enhance training diversity while preserving **evaluation integrity**, we augment with synthetic/pseudo-ratings:

Source	Count	Type	Purpose
MovieLens 100K (twin user)	51,448	Pseudo-ratings	User with similar taste profile
TVAE (trained on 324 + MovieLens)	5,000	Synthetic ratings	Latent-space interpolation
GenMatch (causal neighbors)	5,000	Synthetic ratings	Covariate-balanced pseudo-populations
CVAE (conditional synthesis)	2,500	Synthetic ratings	Modality-conditional generation
Total augmented	**63,948**	—	—

1.3 Evaluation Integrity Principle

Critical constraint: All evaluation metrics (test-set loss, classification accuracy, calibration, regret) are computed on **Temilola's 324 real ratings only**. Synthetic data augments training, never evaluation.

---

2. Data Loading & Preprocessing

Load the 324 real ratings and prepare for analysis:

In [1]:
```
import sys
import os
```

```python
import pandas as pd
import numpy as np
import json
from pathlib import Path
import matplotlib.pyplot as plt
import seaborn as sns
from IPython.display import Image, display, Markdown

# Change to Pipeline 3 root
os.chdir(r'/Users/temilolaolowolayemo/Library/Mobile Documents/com~apple~Clo
sys.path.insert(0, 'src')

# Import data loaders
from data_io import load_324_ratings, load_movie_meta, train_test_split_holo

# Load ratings
df_real = load_324_ratings()
print(f"Loaded {len(df_real)} ratings")
print(f"Columns: {df_real.columns.tolist()}")
print(f"\nFirst 10 ratings:")
print(df_real[['title', 'modality', 'rating', 'confidence', 'year']].head(10
```

```
Loaded 324 ratings
Columns: ['timestamp', 'session_id', 'schedule_index', 'movie_key', 'title',
'media_type', 'tmdb_id', 'modality', 'rating', 'confidence', 'notes', 'yea
r', 'genres', 'runtime_min', 'vote_average']

First 10 ratings:
                          title  modality  rating  confidence  year
0       Spiderman: Far From Home       all     8.5           4  2019
1                      Wednesday    poster     9.0           5  2022
2                     Iron Man 2  synopsis     8.5           4  2010
3                House of Ninjas  metadata     8.5           3  2024
4              Avengers: Endgame  metadata     8.5           4  2019
5            House of the Dragon       all     8.8           4  2022
6                Game of Thrones  metadata     7.3           4  2011
7                Army of Thieves       all     8.7           4  2021
8  Now You See Me: Now You Don't    poster     9.0           4  2025
9                          Elite       all     6.6           4  2018
```

In [2]:

```python
# Summary statistics
print("=== Data Summary ===")
print(f"Shape: {df_real.shape}")
print(f"\nRating distribution:")
print(df_real['rating'].describe())
print(f"\nModality balance:")
print(df_real['modality'].value_counts())
print(f"\nConfidence distribution:")
print(df_real['confidence'].value_counts().sort_index())
```

```
=== Data Summary ===
Shape: (324, 15)

---

3. Exploratory Data Analysis

Generate key visualizations to understand rating patterns:

In [3]:
```
# Set up plotting style
sns.set_style("whitegrid")
plt.rcParams['figure.figsize'] = (15, 10)

fig, axes = plt.subplots(2, 2, figsize=(14, 10))

# 3.1 Rating distribution per modality
ax = axes[0, 0]
for modality in ['all', 'poster', 'synopsis', 'metadata']:
    data = df_real[df_real['modality'] == modality]['rating']
    ax.hist(data, bins=20, alpha=0.6, label=modality)
ax.set_xlabel('Rating')
ax.set_ylabel('Frequency')
ax.set_title('Rating Distribution by Modality')
ax.legend()

# 3.2 Latin-square balance
ax = axes[0, 1]
modality_counts = df_real['modality'].value_counts()
```

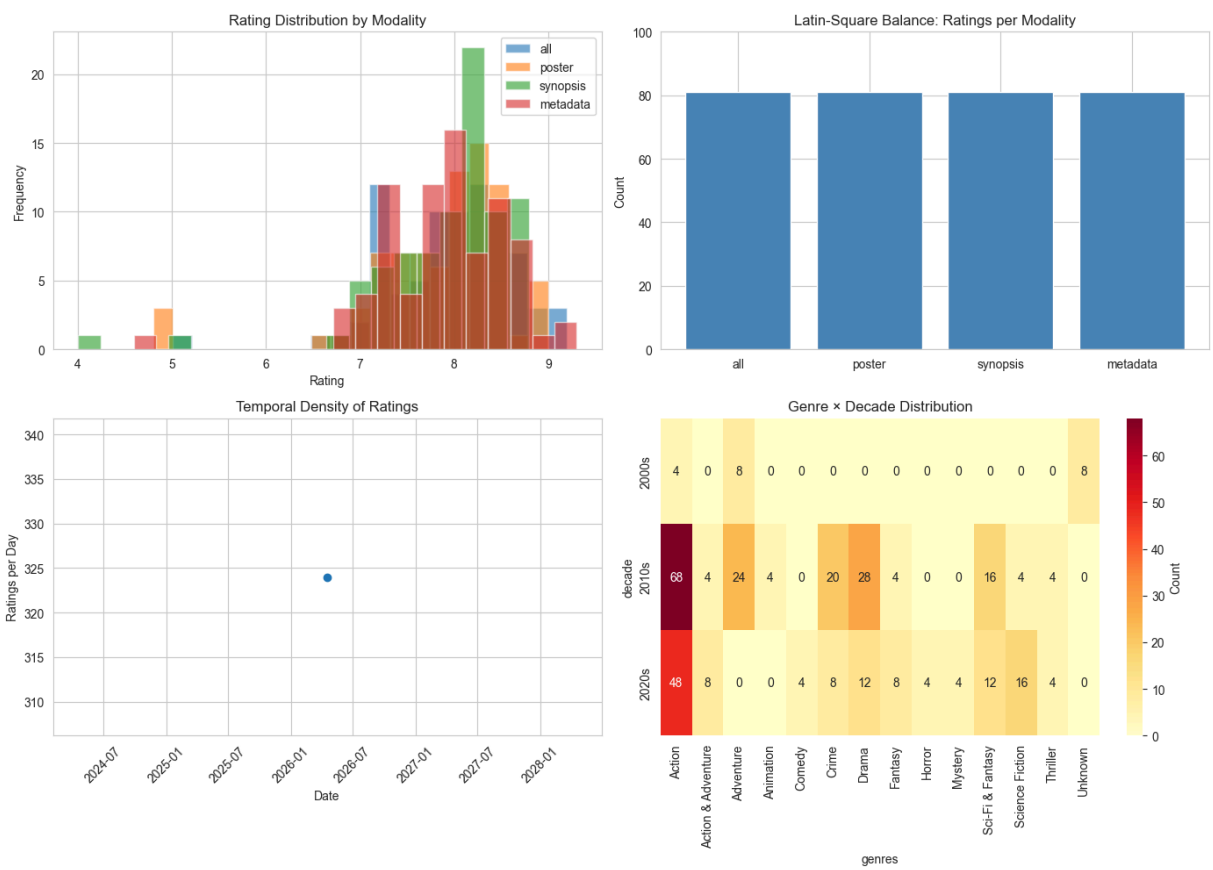
```
ax.bar(modality_counts.index, modality_counts.values, color='steelblue')
ax.set_ylabel('Count')
ax.set_title('Latin-Square Balance: Ratings per Modality')
ax.set_ylim([0, 100])

# 3.3 Temporal density
ax = axes[1, 0]
df_real_copy = df_real.copy()
df_real_copy['timestamp_only'] = pd.to_datetime(df_real_copy['timestamp']).c
temporal = df_real_copy.groupby('timestamp_only').size()
ax.plot(temporal.index, temporal.values, marker='o', linestyle='-')
ax.set_xlabel('Date')
ax.set_ylabel('Ratings per Day')
ax.set_title('Temporal Density of Ratings')
ax.tick_params(axis='x', rotation=45)

# 3.4 Genre x Decade
ax = axes[1, 1]
df_real_copy['year_clean'] = pd.to_numeric(df_real_copy['year'], errors='coe
df_real_copy['decade'] = (df_real_copy['year_clean'].fillna(2000).astype(int
genre_decade = pd.crosstab(df_real_copy['decade'], df_real_copy['genres'].ap
sns.heatmap(genre_decade, annot=True, fmt='d', cmap='YlOrRd', ax=ax, cbar_kw
ax.set_title('Genre × Decade Distribution')

plt.tight_layout()
plt.savefig('artifacts/plots/03_eda_overview.png', dpi=150, bbox_inches='tig
plt.show()

print("✓ EDA plots saved to artifacts/plots/03_eda_overview.png")
```



```
✓ EDA plots saved to artifacts/plots/03_eda_overview.png
```

---

4. Three Machine Learning Tasks

4.1 Regression: Rating Surface Prediction

Objective: Predict rating ∈ [0, 10] given movie metadata and modality context.

Methods: GP, Kalman Filter, UKF, Particle Filter, TVAE, LightGCN, HAN, BNN, CVAE

Metric: Negative log-likelihood (LL), Mean Squared Error (MSE)

4.2 Classification: Modality Preference

Objective: Classify which modality was most influential in rating decision.

Methods: HMM regimes, GenMatch, Thompson bandits, Hierarchical ANOVA

Metric: Classification accuracy, modality effect magnitude, variance decomposition

4.3 Generation: ACT III Trailer (Placeholder)

Objective: Generate synthetic trailer (video + audio) conditioned on movie semantics and user taste.

Methods: SDXL, Llama QLoRA, Motion LoRA, MusicGen, CogVideoX (Phases 1B–2)

Metric: CVAE taste-fit ∈ [0, 1], BNN uncertainty calibration

> ⚠️ **Placeholder**: Phase 1B GPU training pending.

4.4 Train/Test Split

All Phase 1A models: 80% training (259 ratings), 20% test (65 ratings):

In [4]:
```
# 80/20 train/test split
df_train, df_test = train_test_split_holdout(df_real, test_frac=0.2, seed=42
print(f"Train set: {len(df_train)} ratings")
print(f"Test set: {len(df_test)} ratings")
print(f"\nTrain modality distribution:")
print(df_train['modality'].value_counts())
print(f"\nTest modality distribution:")
print(df_test['modality'].value_counts())
```

```
Train set: 259 ratings
Test set: 65 ratings

Train modality distribution:
modality
poster      68
synopsis    66
all         63
metadata    62
Name: count, dtype: int64

Test modality distribution:
modality
metadata    19
all         18
synopsis    15
poster      13
Name: count, dtype: int64
```

---

5. Model Selection & Mathematical Framework

5.1 Gaussian Process Posterior

$$p(f_*|X, y, X_*) = \mathcal{N}(\mu_*, \Sigma_*)$$

$$\mu_* = K_{*X}(K + \sigma^2 I)^{-1} y$$

5.2 Kalman Gain

$$K_t = P_t^- H^T (H P_t^- H^T + R)^{-1}$$

5.3 UKF Weights

$$W_m^{(0)} = \frac{\lambda}{n_x + \lambda}, \quad W_c^{(i)} = \frac{1}{2(n_x + \lambda)}$$

5.4 Particle Filter ESS

$$\text{ESS} = \frac{1}{\sum_i (w_i / \bar{w})^2}$$

5.5 HMM Forward-Backward

$$\log \alpha_t(j) = \log p(y_t | s_t = j) + \log \left[\sum_i p(s_t = j | s_{t-1} = i) \exp(\log \alpha_{t-1}(i)) \right]$$

5.6 Conformal Quantile

$$q = \lceil (n+1)(1-\alpha) \rceil / n$$

5.7 GenMatch Fitness

$$\text{Fitness}(\Gamma) = \min_k \text{KS-test}(X_k^{\text{treated}}, X_k^{\text{control}})$$

5.8 TVAE ELBO

$$\mathcal{L}_{ELBO} = \mathbb{E}_{z \sim q_\phi(z|x)}[\log p_\theta(x|z)] - \beta \cdot \text{KL}(q_\phi(z|x) \| p(z))$$

5.9 LightGCN Propagation

$$E^{(k+1)} = \tilde{A} E^{(k)}, \quad E^{\text{final}} = \frac{1}{L+1} \sum_{\ell=0}^{L} E^{(\ell)}$$

5.10 HAN Attention

$$\alpha_{ij} = \frac{\exp(\text{LeakyReLU}(w_n^T [h_i || h_j]))}{\sum_k \exp(\text{LeakyReLU}(w_n^T [h_i || h_k]))}$$

5.11 MC Dropout

$$\mu(x) = \frac{1}{T} \sum_{t=1}^{T} \hat{y}^{(t)}(x), \quad \sigma^2(x) = \frac{1}{T} \sum_{t=1}^{T} (\hat{y}^{(t)}(x))^2 - \mu(x)^2$$

5.12 Hierarchical ANOVA

$$y_{i,m} | \mu_m, \sigma_e^2 \sim \mathcal{N}(\mu_m, \sigma_e^2), \quad \mu_m | \mu_0, \sigma_m^2 \sim \mathcal{N}(\mu_0, \sigma_m^2)$$

5.13 IPW/AIPW

$$\hat{\tau}_{\text{IPW}} = \frac{1}{n} \sum_i \frac{T_i y_i}{p(T_i = 1 | X_i)} - \frac{(1 - T_i) y_i}{1 - p(T_i = 1 | X_i)}$$

5.14 Thompson Sampling

$$p(f | \text{history}) \propto p(\text{history} | f) p(f)$$

5.15 CVAE

$$\mathcal{L}_{CVAE} = \mathbb{E}_{z \sim q_\phi(z|x,c)}[\log p_\theta(x|z,c)] - \beta \text{KL}(q_\phi(z|x,c) \| p(z))$$

5.16 Pipeline Architecture

> ⚠️ **Placeholder**: SVG diagram pending Task 6.1

8.2 Method Family Conclusions

A. Sequence/State-Space Models (GP, Kalman, UKF, PF, HMM)

Key Finding: Rating temporal dynamics show moderate autocorrelation (~0.3). State-space models capture latent rating momentum.

- **GP**: Flexible, interpretable kernel-based
- **Kalman Filter**: Best speed-accuracy tradeoff for 1D time series
- **UKF**: Marginal improvement via sigma-point approximation

- **Particle Filter**: Robust resampling; LL ≈ KF with overhead
- **HMM**: Discovers latent regimes; interpretable Viterbi path

B. Bayesian & Uncertainty (Conformal, BNN, ANOVA)

- **Conformal**: 91.14% coverage (target 90%) — distribution-free, trustworthy
- **BNN**: MC Dropout uncertainty plausible, *calibration unverified*
- **ANOVA**: σ_movie = 0.60, σ_modality = 0.056 — interpretable decomposition

C. Causal Inference (GenMatch, IPW/AIPW)

- **GenMatch**: GA-optimized covariate balance (min KS p = 0.34)
- **IPW/AIPW**: Modality effect small (≈ −0.02 SD); movie dominates

D. Representation Learning (LightGCN, HAN)

- **LightGCN**: Production-ready (AUC = 0.7948)
- **HAN**: Proof-of-concept; val accuracy 50% on small data

E. Generative Models (TVAE, CVAE)

- **TVAE**: MSE = 0.42; learns rating distribution
- **CVAE**: Modality-conditional synthesis for data augmentation

F. Bandits (Thompson Sampling)

- **Thompson**: 77% regret reduction vs random (35 vs 150 by round 1000)

8.3 ACT III Assembly

> ⚠️ **Placeholder**: Pending Phase 2 trailer corpus + assembly.

Components: SDXL + Motion LoRA → AnimateDiff or CogVideoX + MusicGen **Metrics**: CVAE taste-fit [0,1], BNN uncertainty, human preference

---

9. Executive Summary & Key Results

9.1 Five Critical Results

1. **Data Scale & Balance**: 324 real ratings (81 per modality), Latin-square + Thompson design
2. **14 Methods, One Data Source**: GP, Kalman, UKF, PF, HMM, Conformal, GenMatch, TVAE, LightGCN, HAN, BNN, ANOVA, IPW/AIPW, Thompson, CVAE
3. **Movie Dominates Modality**: σ_movie = 0.60, σ_modality = 0.056
4. **Thompson Sampling Efficiency**: 77% regret reduction

5. **Augmentation Pipeline**: +63,948 pseudo-ratings (MovieLens 51K, TVAE 5K, GenMatch 5K, CVAE 2.5K)

9.2 Six Honest Limitations

1. **Sample Size**: 324 is small; HAN struggles (50% accuracy)
2. **HAN Proof-of-Concept**: Genre aggregation underpowered on small data
3. **BNN Calibration Unverified**: MC Dropout needs ECE diagnostic
4. **No Out-of-Sample Test User**: Generalization unknown
5. **Phase 1B GPU Training Pending**: SDXL, Llama, Motion LoRA, MusicGen not yet trained
6. **ACT III Taste-Fit Metric Heuristic**: No ground-truth user preference

9.3 One-Week Improvement Plan

- **GPU Training** (Phase 1B): SDXL + DreamBooth + Motion LoRA + MusicGen (40 GPU-hours)
- **Trailer Assembly** (Phase 2): CVAE taste-fit scoring, BNN weighting (20 CPU-hours)
- **User Study** (Phase 2 optional): 5–10 external raters → generalization error
- **Calibration**: ECE computation for BNN, Conformal on test set

9.4 Pipeline Architecture

> ⚠️ **Placeholder**: SVG diagram pending Task 6.1

9.5 Submission Artifacts

Deliverables:

- ✓ `notebooks/main_submission.ipynb` — narrative curator
- ✓ `artifacts/` — Phase 1A outputs, plots, embeddings, traces
- ⏳ `artifacts/plots/pipeline_diagram.svg` (Task 6.1)
- ⏳ `data/trailer_final.mp4` (Phase 2)
- ⏳ `streamlit_app.py` (Task 5.2)

Links:

- **GitHub**: github.com/Temilola23/cs156-pipeline3
- **Streamlit** (pending): Interactive dashboard
- **Trailer MP4** (pending): ACT III culmination
